NAME

ppmdcfont - Turn a Ppmdfont file into C source for a builtin font

SYNOPSIS

ppmdcfont

(There are no arguments or options)

DESCRIPTION

This program is part of Netpbm.

ppmdcfont creates a C source file that you can compile into a built-in font for use with the Netpbm PPM drawing facilities. It reads a Ppmdfont file on Standard Input and writes the C source code to Standard Output.

The output C source code has the font object's name hardcoded as **ppmd_standardfont**, which you will definitely want to edit, because that is the name of the font built in to **libnetpbm**. If you don't change it, it will conflict both cognitively and in program linking. There should obviously be an option on **ppmdcfont** to choose this, but the development effort has not been justified so far.

See Libnetpbm PPM Drawing Function Manual for details on Ppmdfont files.
